**Faktor-Faktor yang berhubungan dengan Perilaku Perawat Dalam Penerapan Pencegahan *Healthcare Associated Infections (HAIs)* di Instalasi Rawat Inap RSUD Siti Fatimah Provinsi Sumatera Selatan Tahun 2024**  
**(xv+85 halaman, 13 tabel, 3 Gambar, 4 lampiran)**

**ABSTRAK**

Data dari komite PPI RSUD Siti Fatimah, didapatkan bahwa masih terdapat angka kejadian *HAIs* pada tahun 2023. Oleh karena itu, penelitian ini bertujuan untuk mengetahui faktor-faktor yang berhubungan dengan perilaku perawat dalam penerapan pencegahan *Healthcare Associated Infections (HAIs)*.

Penelitian ini dilakukan di RSUD Siti Fatimah pada tanggal 8-19 Januari 2024. Teknik pengumpulan data menggunakan kuesioner. Desain penelitian yang digunakan adalah *observational analitik*. Populasi dan sampel dalam penelitian ini adalah perawat di Instalasi Rawat Inap berjumlah 99 orang.

Analisis data yang digunakan adalah univariat dan bivariat dengan uji *chi-square*. Hasil penelitian menunjukkan perawat dengan pengetahuan baik sebanyak 56 responden (57%), perawat yang menyatakan sarana lengkap sebanyak 74 responden (75%), perawat dengan motivasi tinggi sebanyak 83 responden (84%) dan perawat yang menerapkan perilaku pencegahan *HAIs* sebanyak 61 responden (62%). Ini menunjukkan ada hubungan antara pengetahuan dengan perilaku perawat dengan nilai *p-value*=0.001. Ada hubungan antara motivasi dengan perilaku perawat dengan nilai *p-value*=0.014. Tidak ada hubungan antara sarana prasarana dengan perilaku perawat dalam penerapan pencegahan *HAIs* dengan nilai *p-value*=0.167.

Oleh karena itu, perlu dilakukannya peningkatan pengetahuan perawat tentang konsep *Healthcare Associated Infections (HAIs)* melalui berbagai kegiatan serta perlunya *reward* kepada perawat agar termotivasi lagi dalam menerapkan perilaku yang baik dan benar pada saat bekerja.

**Factors associated with Nurse Behavior in Implementing the Prevention of Healthcare Associated Infections (HAIs) in the Inpatient Installation of Siti Fatimah Hospital, South Sumatra Province, 2024**  
(xv+85 pages, 13 tables, 3 figures, 4 appendices)

**ABSTRACT**

Retrieved from the PPI committee of Siti Fatimah Hospital found that there was an incidence of HAIs in 2023. Therefore, this study aims to determine the factors associated with nurse behavior in implementing the prevention of Healthcare Associated Infections (HAIs).

This research was conducted at Siti Fatimah Hospital on January 8-19, 2024. The data collection technique used a questionnaire. The research design used was observational analytic. The population and sample in this study were nurses in the Inpatient Installation totaling 99 people.

Data analysis used was univariate and bivariate with chi-square test. The results showed that nurses with good knowledge were 56 respondents (57%), nurses who stated complete facilities were 74 respondents (75%), nurses with high motivation were 83 respondents (84%) and nurses who implemented HAIs prevention behavior were 61 respondents (62%). This shows there is a relationship between knowledge and nurse behavior with a p-value = 0.001. There is a relationship between motivation and nurse behavior with a p-value = 0.014. There is no relationship between infrastructure and nurses' behavior in implementing HAIs prevention with p-value=0.167.

Therefore, it is necessary to increase nurses' knowledge about the concept of Healthcare Associated Infections (HAIs) through various activities and the need for rewards to make nurses more motivated in implementing good and correct behavior at work.
